

# Add-Text | Software

## System Requirements:

Add-Text is designed to run on computers running Windows 98, 2000, ME and XP or Mac OS 8.6 or higher including OS X.

There are three different versions of the software, one for Windows, one for Mac OS 8.6-9.2.2 and one for Mac OS X, make sure you have downloaded the correct version to run on your computer - you can tell from the name of your download.

## Instructions:

Once downloaded you need to copy the 'add-text (copy to your hard disk)' folder to your hard disk. You will need a copy of the whole folder for each user so it's useful to rename the copied folder to something like your name or the user's name.

Now you have your own copy of add-text, you can open the application by opening the folder and double-clicking the 'add-text' icon.

To import your own picture into add-text make sure it is saved as a jpeg file and called: background.jpg

Put it in the folder called 'background' replacing the existing file (the folder called 'background' is in the 'add-text' folder).

Finally, double-click the 'add-text' icon again.

To reveal the add-text interface, click just below your picture or the instructions picture if you haven't imported your own yet.

Once the interface is revealed you can add and remove text boxes, stack them closer or deeper if they overlap and add text to any text boxes you have created. You can also resize any text box by holding down the shift key, clicking on it and dragging the mouse (without letting go of the button).

Once you have added some text boxes and text you can save your project by clicking the 'SAVE' button and view it by clicking the 'VIEW' button. When you are in view mode the interface will disappear and moving the mouse around your picture should reveal your text.

Click below the picture again to get the interface back.

# Add-Text | Software

## Known Bugs:

You cannot type single or double quotes into text boxes, they will appear and then immediately disappear, this is normal.

If you try to open add-text and see this error message:

Unable to load movie playlist. Does the .INI file exist? It must contain a section '[Movies]' with an entry 'Movie01=Pathname.dir'.

Try moving the 'add-text (copy to your hard disk)' folder to the desktop and opening it. This error occurs when the length of the path to the projector exceeds 127 characters.
